**Attention: Mr M Crowley**

Dear Michael

**RE: Geotechnical Completion Report for Residential Subdivision at 23 and 45 McQuoids Road,  
Flat Bush**

This report presents all supporting geotechnical data and our Suitability Statement in relation to land development works undertaken at the above location.

It has been prepared in accordance with instructions received from Hugh Green Limited and forms part of the documentation required by Auckland Council to achieve certification under Section 224(c) of the Resource Management Act.

If you have any queries or you require any further clarification on any aspects of this report, please do not hesitate to contact the undersigned.

For and on behalf of Lander Geotechnical Consultants Limited

**D.A. Tookey**  
Senior Geotechnical Engineer  
MIPENZ. CPEng

## 1 INTRODUCTION AND DESCRIPTION OF SUBDIVISION

This Geotechnical Completion Report has been prepared for Hugh Green Limited as part of the documentation required to be submitted to the Auckland Council following residential subdivisional development.

It contains our Suitability Statement, relevant test data and the Dodd Civil Consultants Limited as-built plan set relating to the 23 and 45 McQuoids Road Residential Subdivision as follows:

**Table 1: Dodd Civil Consultants Limited As-Built Plans**

Title	Reference No.	Date
Pre-Construction Levels	503/02 – 901 to 902	28/11/2016
Earthworks As-Built Plan	503/02 – 903 to 904	28/11/2016
Cut / Fill As-Built Plan	503/02 – 905 to 906	28/11/2016
Geotech Specific Design Zone	503/02 - 907	28/11/2016
Stormwater As-Built Plans	503/02 – 910 to 916	28/11/2016
Sanitary Sewer As-Built Plans	503/02 – 920 to 927	28/11/2016

This report covers the construction period February to October 2016. It is intended to be used for certification purposes as follows:

- 97 residential lots numbered 1 to 97
- 4 new roads named Carrygawley Rd, Lisnoble Rd, Ballinabreen Rd, and Kilcadden Rd  
1 recreation reserve numbered as lot 100
- 1 drainage reserve numbered as lot 101

This subdivision is located at 23 and 45 McQuoids Road, Flat Bush and as can be seen on the fill as-built plan, a total of 56 of the lots have been partly or totally affected by filling, to a maximum depth of approximately 5m.

## 2 RELATED REPORTS

A Geotechnical Investigation Report on the subject land was prepared by this Consultancy, reference J00092, dated 30 June 2015. The conclusions and recommendations of that report have been reviewed during the preparation of this document.

## 3 EARTHWORKS OPERATIONS

### 3.1 Plant

The main items of plant used by the Contractor, Twomey Construction Limited were:

- 2 x 20ton Excavators
- 2 x CAT 815 Compactor

- 2 x CAT 627 Scraper
- 1 x D5 Bulldozer and Discs

### **3.2 Construction Programme**

Earthworks operations for this subdivision commenced in February 2016 with stripping of the northern portions of the gully that extended through site (starting near Lot 1 and working south east). A subsoil drain with two hiway grade perforated novacoils, drainage aggregate and geotextile wrapped was installed in the base of the gully. A silt pond was then constructed over this area for sediment control purposes.

Through March, earthworks continued up the gully (i.e. to the south east) with the gully being mucked out to competent material, the subsoil drain being installed and then fill being placed. In mid-March the pond in the centre of the site (in the vicinity of Lots 31 to 33) was completely mucked out and the two novacoils were split with one drain following the gully to the south and the other following a tributary gully to the east.

In late March works commenced in the gully adjacent to the southern boundary with muck out being completed and a subsoil drain with a single novacoil being installed. Filling commenced through this area in early April following construction of a silt pond at the western end of the gully.

Stripping of the area adjacent to McQuoids Rd occurred through April and uncontrolled fill was noted through a portion of this area. The fill contained minor roots, gravel and wet clay. These materials were undercut down to natural ground and sorted for reuse in the fill with remaining materials being placed in unsuitable stockpiles.

By May the majority of the earthworks on site were completed and topsoil respread was carried out over the bulk of the site.

Through June to August the two retaining walls and pipe bridge were constructed and silt ponds were backfilled. To ensure adequate conditioning of material lime stabilisation of the fill placed in the south western silt pond was carried out.

## **4 QUALITY ASSURANCE AND CONTROLS**

### **4.1 Inspections**

During the earthworks engineering inspections were undertaken on a regular basis to assess compliance with NZS 4431 and our project specific recommendations and specifications. Project specific inspections were required on this development for:

- gully areas prior to the placement of fill materials to ascertain that all mullock and soft inorganic subsoils had been removed to our satisfaction
- installation of underfill drains through gully alignments
- silt traps prior to backfilling to ensure that all silt had been removed and that the sides of the excavation were benched where necessary
- retaining wall and pipe bridge pile hole excavations (covered in a separate Producer Statement – Construction Review, PS4)

## 4.2 Quality Control Criteria

Due to the varying soil types being used as filling, the compaction control criteria of minimum allowable shear strength and maximum allowable air voids were mainly used for quality assurance purposes.

Specification details were as follows:

### Minimum Shear Strength and Maximum Air Voids Method

- |     |   |         |
|-----|---|---------|
| (a) | <u>Air Voids Percentage</u>   |         |
|     | (As defined in NZS 4402)  |         |
|     | General Fill  |         |
|     | Average value less than   | 10%     |
|     | Maximum single value  | 12%     |
|     | Within 500mm of carriageway subgrade                                |         |
|     | Average value less than   | 8%      |
|     | Maximum single value  | 10%     |
| (b) | <u>Undrained Shear Strength</u>                                     |         |
|     | (Measured by Pilcon shear vane - calibrated using NZGS 2001 method) |         |
|     | General fill  |         |
|     | Average value not less than   | 140 kPa |
|     | Minimum single value  | 110 kPa |
|     | Within 500mm of carriage subgrade                                   |         |
|     | Average value not less than   | 150 kPa |
|     | Minimum single value  | 120 kPa |

Note: The average value shall be determined over any ten consecutive tests

## 4.3 Quality Assurance Testing

In-situ density monitoring was carried out as for the general fill areas for quality control as follows:

- Regular in-situ density, strength and water content tests were carried out on all areas of the filling at or in excess of the frequency recommended by NZS 4431.
- Control tests carried out on the filling showed that on several occasions the required compaction standards were not being achieved. Further two marginal tests (tests 33 and 34) were considered acceptable by engineering observation.
- Results of the test failures and marginal passes were relayed to the site foreman and/or his staff, and to the best of our knowledge the affected areas of fill were re-worked as necessary. In each failure case, further testing was carried out until compliance with the standards was achieved.

## **5 PROJECT EVALUATION**

### **5.1 Bearing Capacity and Settlement of Building Foundations**

Following the completion of earthworks operations, we returned to the site and drilled a series of hand auger boreholes at appropriate natural ground locations in order to determine representative finished ground conditions and hence evaluate likely foundation options for future building development.

At current subgrade levels all filled and undisturbed natural ground has a geotechnical ultimate bearing capacity of 300kPa within the influence of conventional shallow residential building foundation loads.

It should be noted that NZS 3604 only allows a maximum backfill depth of 600mm over the building platform of a dwelling unless an Engineering design solution is proposed, on account of the risk of induced consolidation of the subsoils caused by the weight of the backfill.

### **5.2 Expansive Soils**

Four sets of expansive soil tests were carried out on samples selected from around the site and within the zone of likely influence of shallow building foundations.

These limit tests were carried out in accordance with NZS 4402, "Methods of Testing Soils for Civil Engineering Purposes" test section 2 and were primarily intended to assess the Expansive Classes of the site materials as defined in AS 2870, "Residential Slabs and Footings – Construction".

The AS 2870 Site Class for this subdivision is M (moderate) and the characteristic surface ground movement is up to 40mm. Specific design alternatives for this Site Class is presented in the Suitability Statement.

If on-grade floor slab construction takes place during a hot dry summer, slab uplift may be caused if construction occurs on dried out and highly desiccated floor subgrades. Thorough soaking of exposed building platform areas a few days before hardfill placement can help to limit the problem. Careful detailing of construction joints in brittle building elements can also be of benefit but this will depend on the architectural specification for each building.

It is also common knowledge that a wide range of tree and shrub species have high groundwater demands during the summer months. The effects of such demands on expansive soils can be substantial and can lead to differential building settlements well in excess of 25mm, with resulting cracking in wall panels and floor slabs. Accordingly, it is a good housekeeping measure to ensure that high water demand species (such as gum, willow, cypress etc) are not planted in the vicinity of buildings. Minimum recommended distances vary with tree species and specialist advice should be obtained.

### **5.3 Lot Gradients**

Generally, gradients across all lots are relatively low angle (i.e. less than 1V:7H or 8 degrees) and stability conditions across the site have been improved by the earthworks and drainage carried out. It is noted however that gradients of the land within the drainage reserve (Lot 101) and area west of lots 92 to 95 are up to 1V:3H (19 degrees) and building restrictions on Lots 92 to 96 adjacent to these slopes are presented on the Geotech Specific Design Zone plan and in our Suitability Statement, on account of a propensity for long term soil creep.

## **5.4 Fill Induced Settlement**

As a result of our pre-gully fill inspections, the installation of subsoil drainage, quality control testing and the elapsed time since the placement of the majority of the filling, we are of the opinion that induced differential settlements beneath or within the certified filling due to its imposed weight should be insignificant with respect to conventional NZS 3604 residential building development.

## **5.5 Stormwater Controls**

It is important on all sloping lots that due care is paid to the design and construction of appropriate stormwater disposal systems. These systems should serve to collect all runoff from roofs, decks and paved areas, together with discharges from retaining wall drains and other subsoil drains and should connect directly into the public stormwater drainage network.

Uncontrolled stormwater discharges onto the ground surface or into soakage pits can cause erosion, scour and/or instability on sloping land and should not be permitted under any circumstances where stability could be compromised.

## **5.6 Service Trenches**

As is normal on all subdivisions, building developments involving foundations within a 45 degree zone of influence from pipe inverts will require Engineering input.

## **5.7 Land Drainage**

The appended earthworks as-built plans show the positions of perforated underfill drains that were placed in mucked out gully inverts prior to filling to tap groundwater seepages particularly when land gradients were greater than 1 in 4, as required by NZS 4431.

The drains outlet at wingwalls and rock rip rap associated with the storm water system in the drainage reserves in the locations indicated on the as-built plans.

These drains were intended to intercept localised groundwater seepages and springs during earthworks and to help provide general control over groundwater levels and were installed as a precautionary measure, not as remedial works for any existing instability and therefore they need no specific maintenance. They are typically buried beneath 2m to 5m of filling and as such present no constraints to foreseeable shallow foundations from end uses.

## **5.8 Road Subgrades**

Penetration resistance tests were undertaken at regular interval/ on the road subgrades and the results were subsequently forwarded to Dodd Civil Consultants Limited for pavement design purposes. Areas demonstrating low equivalent CBR values were generally undercut with increased metal depths being the preferred remedial option.

## **5.9 Retaining Walls**

Retaining walls have been utilised to stabilise the site in the recreation reserve (Lot 100) and drainage reserve (Lot 101) in the locations shown on the Earthworks as-built plans. These walls reach a maximum height of approximately 5.5m and were designed and inspected by Dodd Civil Consultants

Limited with ground conditions being confirmed by this Consultancy. A separate Producer Statement – Construction Review (PS4) certifies these walls.

Details of resulting building and earthworks restrictions within the vicinity of these walls are presented on the Geotech Design Zone Plan and in the Suitability Statement.

### **5.10 Topsoil**

Topsoil depths in likely building platform areas were checked by the drilling of a borehole in the approximate centre of each of the lots. Our findings, which are indicative only and subject to variation at other locations, show that likely topsoil depths are between 50mm and 400mm.

Site specific findings are presented in the Suitability Statement Summary Table.

### **5.11 Contractor's Work**

We have relied on the Contractor's work practices and assume that the works have been carried out in accordance with:

- (i) The approved Contract drawings and design details,
- (ii) The approved Contract specifications,
- (iii) Authorised Variations to (i) and (ii) during the execution of the works,
- (iv) The conditions of Resource, Earthworks and Building Consents where applicable,
- (v) The relevant Lander Geotechnical Consultants Limited reports, recommendations and site instructions,

and that all as-built information and other details provided to the Client and/or Lander Geotechnical Consultants Limited are accurate and correct in all respects.

## **6 STATEMENT OF PROFESSIONAL OPINION AS TO THE SUITABILITY OF LAND FOR BUILDING DEVELOPMENT**

I, S.G. Lander, of Lander Geotechnical Consultants Limited, Auckland, hereby confirm that:

1. I am a Chartered Professional Engineer experienced in the field of geotechnical engineering as defined in section 1.2.3 of NZS 4404 and was retained by the Owner/Developer as the Geotechnical Engineer on the 23 and 45 McQuoids Road subdivision.
2. The extent of preliminary investigations carried out to date are described in Geotechnical Investigation Report reference J00092, dated 30 June 2015 and the conclusions and recommendations of that document have been re-evaluated in the preparation of this report. The results of all tests carried out are appended.
3. In my professional opinion, not to be construed as a guarantee, I consider that:
  - (a) The earth fills shown on the appended fill as-built plan have been placed in compliance with NZS 4431, Auckland Council's Code of Practice for Land development and Subdivision, Section 2 Earthworks and Geotechnical Requirements (version 1.6) and related documents.

- (b) The completed earthworks give due regard to land slope and foundation stability considerations within the residential lots, but as shown on the appended Geotech Design Zone plan, Specific Design Zones apply on lots 92 to 96 as they are adjacent to land having gradients steeper than 1V:4H (14 degrees).

No building construction and no earthworks which increases the slope angle or surcharge loading of these areas should take place in these areas or elsewhere if similar gradients exist unless endorsed by specific site investigations, design of all foundations and retaining walls and by construction inspections undertaken by a Chartered Professional Engineer experienced in geomechanics, as such operations may, in certain circumstances, have detrimental effects on overall site stability.

It is envisaged that the outcome of such specific site investigations is that soil creep will need to be addressed. Typically, at least the leading (downslope) edge foundations may need to be piled to a minimum depth of approximately 3m, depending on actual location and building materials. It is anticipated that a geotechnical ultimate bearing capacity of 450 kPa will be available for the specific design of piles in end bearing. Lateral loading due to soil creep should also be considered by the designer.

- (c) A geotechnical ultimate bearing capacity of 300 kPa may be assumed for foundation design on all lots. Where a geotechnical bearing capacity greater than 300 kPa is required, (ie. outside the limits of NZS 3604, such as when piling is undertaken), further specific site investigation and design of foundations should be carried out prior to building consent application.
- (d) The backfilling and compaction of the stormwater and sanitary sewer trenches on this subdivision has where possible been carried out to appropriate standards having regard for the prevailing ground conditions and associated compaction induced pipe loadings.

Nevertheless, no building development should take place within the 45 degree zone of influence of drain inverts unless endorsed by specific site investigations, foundation designs and by construction inspections undertaken by a Chartered Professional Engineer experienced in geomechanics to ensure that lateral stability and differential settlement issues are addressed and that building loads are transferred beyond the influence of the pipe and beyond the extent of the trench backfill.

- (e) No building construction, including the construction of additional retaining walls and no earthworks should take place should take place within 6m of the front face of the cantilever pole retaining walls on lot 101 (drainage reserve) or within 3m of the front face of the cantilever pile retaining walls on lots 96 (residential lot) and 100 (recreation reserve), unless endorsed by specific designs and by construction inspections undertaken by a Chartered Professional Engineer experienced in geomechanics to ensure that no additional loads are applied to the walls. Specific site investigation should not be required.
- (f) The assessed AS 2870 expansive site Class for all lots is M (moderate) and the characteristic surface ground movement is up to 40mm.
- (g) Subject to the geotechnical limitations, restrictions, recommendations and expansive soil assessments associated with 3(b), 3(c), 3(d), 3(e) and 3(f) above:

- (i) The filled and undisturbed original ground within residential lot boundaries is generally suitable for residential buildings constructed in accordance with NZS 3604 and related documents.
  - (ii) On all lots foundation design may be carried out in accordance with AS 2870 (Class M) or in accordance with NZS 3604 provided that in this latter case the minimum foundation depth below cleared ground level following topsoil removal and benching of building platform areas is 600mm.
4. Road subgrades and lot accessway subgrades have been formed having due regard for slope stability and settlement, although CBR values do vary between natural and filled ground as is to be expected. It is likely that subgrade CBR's will be significantly lower than 7% within any areas of (non-stabilised) natural ground.

The professional opinion contained within this report is furnished to the Auckland Council and Hugh Green Limited for their purposes alone on the express condition that it will not be relied upon by any other person. Prospective purchasers should still satisfy themselves as to any specific conditions pertaining to their particular land interest.

The appended table summarises the status of each residential lot covered by this Suitability Statement.

# Appendix 1

**Dodd Civil Consultants Limited  
As-Built Plan**

**CERTIFICATION**

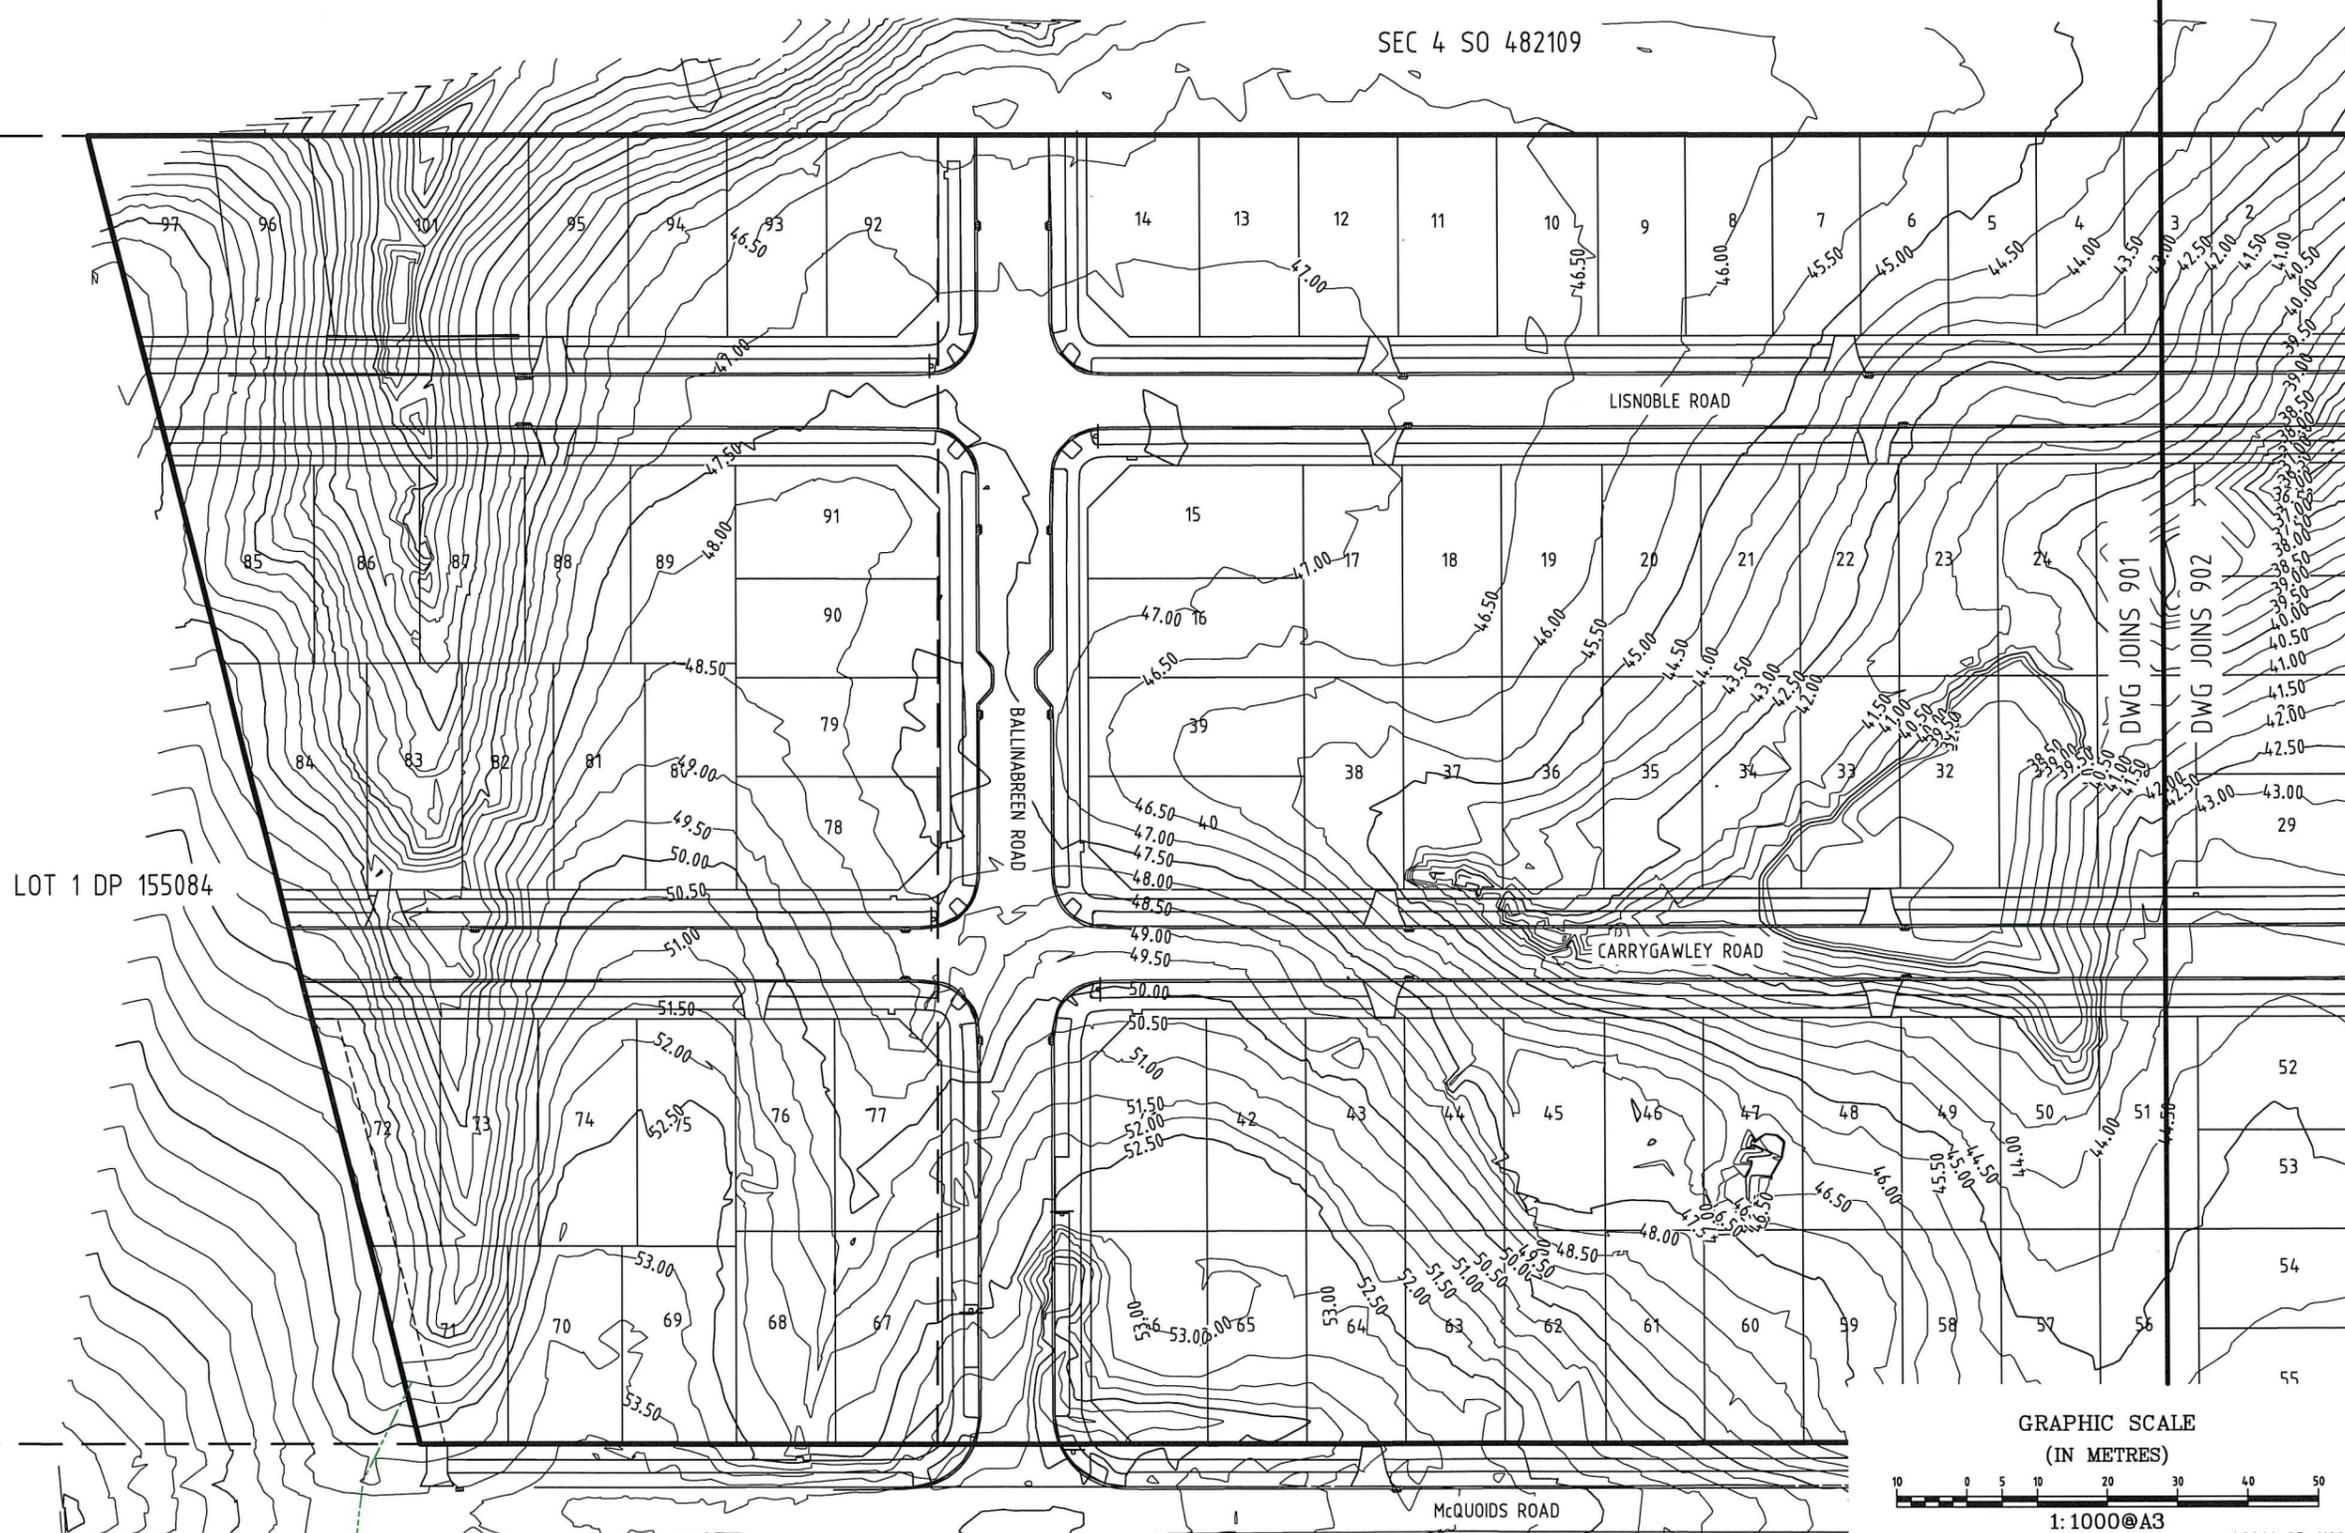

I, CHARTERED PROFESSIONAL ENGINEER, HEREBY CERTIFY THAT THIS AS-BUILT PLAN SHOWS THE PRECONSTRUCTION CONTOURS AS SURVEYED BY OTHERS AND THAT:

- THE COORDINATES (X,Y) ARE IN TERMS OF NZTM ON NZGD(2000), AND ARE WITHIN ±50MM.
- THE LEVELS (Z) ARE IN TERMS OF THE AUCKLAND 1946(MSL) LINZ DATUM (DOSLI DATUM), AND ARE WITHIN ±20MM.

I, CHARTERED PROFESSIONAL ENGINEER, HEREBY CERTIFY THAT THE MANHOLE POSITIONS, SCHEDULE OF CO-ORDINATES, INVERT AND LID LEVELS, AND DISTANCES BETWEEN MANHOLES AND PIPE SIZES ARE CORRECT. CONNECTIONS TO THE LINES HAVE BEEN PLOTTED AND DIMENSIONED FROM INFORMATION SUPPLIED TO US BY THE CONTRACTOR FOR THE WORK.

- THE COORDINATES (X,Y) ARE IN TERMS OF NZTM ON NZGD(2000), AND ARE WITHIN ±50MM.
- THE LEVELS (Z) ARE IN TERMS OF THE AUCKLAND 1946(MSL) LINZ DATUM (DOSLI DATUM), AND ARE WITHIN ±20MM.

DATE: 28-Nov-16

**CERTIFICATION**

I, CHARTERED PROFESSIONAL ENGINEER, HEREBY CERTIFY THAT THE MANHOLE POSITIONS, SCHEDULE OF CO-ORDINATES, INVERT AND LID LEVELS, AND DISTANCES BETWEEN MANHOLES AND PIPE SIZES ARE CORRECT. CONNECTIONS TO THE LINES HAVE BEEN PLOTTED AND DIMENSIONED FROM INFORMATION SUPPLIED TO US BY THE CONTRACTOR FOR THE WORK.

- THE COORDINATES (X,Y) ARE IN TERMS OF NZTM ON NZGD(2000), AND ARE WITHIN ±50MM.
- THE LEVELS (Z) ARE IN TERMS OF THE AUCKLAND 1946(MSL) LINZ DATUM (DOSLI DATUM), AND ARE WITHIN ±20MM.

**Project:** J00092- McQuoids Road, Flat Bush

**Location:** Pond backfill

Tested by: AB

Date tested: 19/08/2016

### EARTHWORKS FILL REPORT

Test Methods : Shear Strength (using field Shear vane in accordance with NZGS 2001); Nuclear Densometer Testing (in accordance with NZS 4407:1991 Test 4.2.1); Water Content Testing (in accordance with NZS 4402:1986 Test 2.1); Density Calculations (in accordance with NZS 4402:1986 Tests 4.1.1.5(b))

**Project No: GENZETAM01144AA**
